

# TINE Release 4.1

## Responding to the User's Needs

Emphasis on *Control System Evolution*

# [ Control System Evolution ]

- Some forces driving 'evolution' :
  - Things are changing around you ...
    - 64-bit OSes are now common
    - Gigabit ethernet is now common
    - New hardware available, Old hardware is obsolete, etc.
    - New technologies appear (and disappear) all the time.
  - Users are requesting change ...
    - 'Fix this bug ...'
    - 'Add this feature ...'
    - 'I need an interface to Software X ...'
  - You want to improve things anyway !

# [ The Red Queen Syndrome ]

‘The most curious part of the thing was that the trees and the other things round them never changed their places at all: however fast they went, they never seemed to pass anything.’

...

‘Now, *here*, you see, it takes all the running *you* can do, to keep in the same place. If you want to get somewhere else, you must run at least twice as fast as that!’

- Lewis Carroll, “Through the Looking Glass”

See also: “The Red Queen” by Matt Ridley

# [The '*Race Condition*' ]

- **Predators and Prey**
  - Predators devise new ways to trap prey
  - Prey devise new ways to escape predators
- **Viruses and the Immune System**
  - (ditto)

*“The natural enemy of the control system developer is the User!”*

# Who are the users?

- Application developers
  - API problems  
“why didn't that work?”, “I need a method to ...”
- Hardware engineers
  - behavioral problems  
“why don't I have an archive of ...”
- Machine physicists/operators
  - systematic problems  
“why do I see a fatal alarm with beam in the machine?”
- Other control systems

*problem* = bug or feature request

# Application Developers and TINE 4.1

## ■ Some new TINE 4.1 API Features

### ○ Security :

- Property specific access lists

`/Context/server/device [property]`

- Access locks

- easier to use
- offer exclusive read

### ○ Optional dispatch routines :

- Property access signals

- accessed, retried, pending, sent, etc.

- Cycle Trigger functions

- Optional dispatch routine

### ○ Data objects 'stamped' with the cycle number

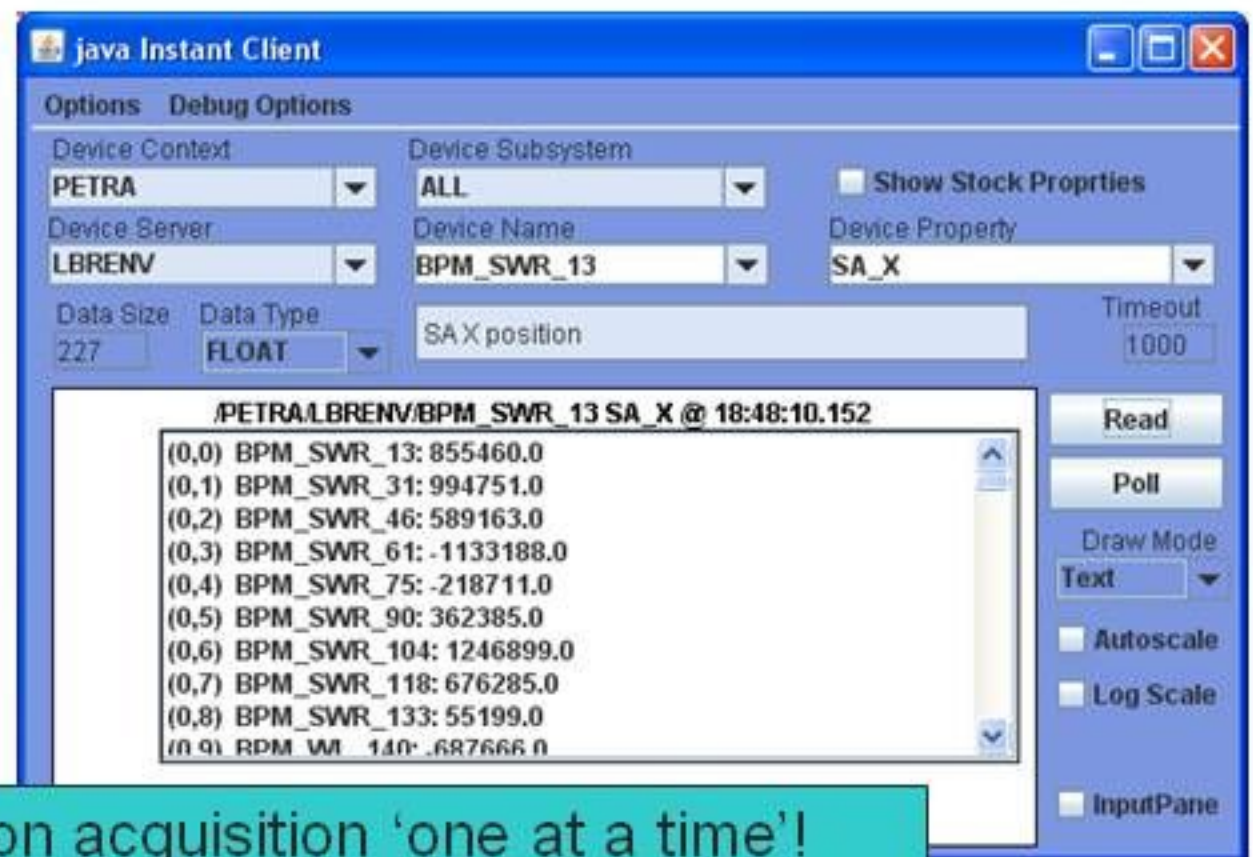

### ○ Scheduling can be eager or lazy

### ○ etc.

# Application Developers and TINE 4.1

- Example of new 'use case' and response :
  - Multi-Channel Arrays (MCAs)

MCAs are an efficient way to atomically deliver a collection of devices (all 300 vacuum pressures, power supply currents, BPMs, temperature sensors, etc.)

Some applications insist on acquisition 'one at a time'!  
-> dispatch gets 300 interrupts/sec instead of 1/sec.

# Application Developers and TINE 4.1

## ■ Solution in TINE 4.1:

MCA acquisition enforced!

- Handshaking returns requested array index and length of array.
- All happens beneath the API !

e.g. BPM Server has several clients getting all 227 horz. and vert. orbit positions

# Hardware Engineers and TINE 4.1

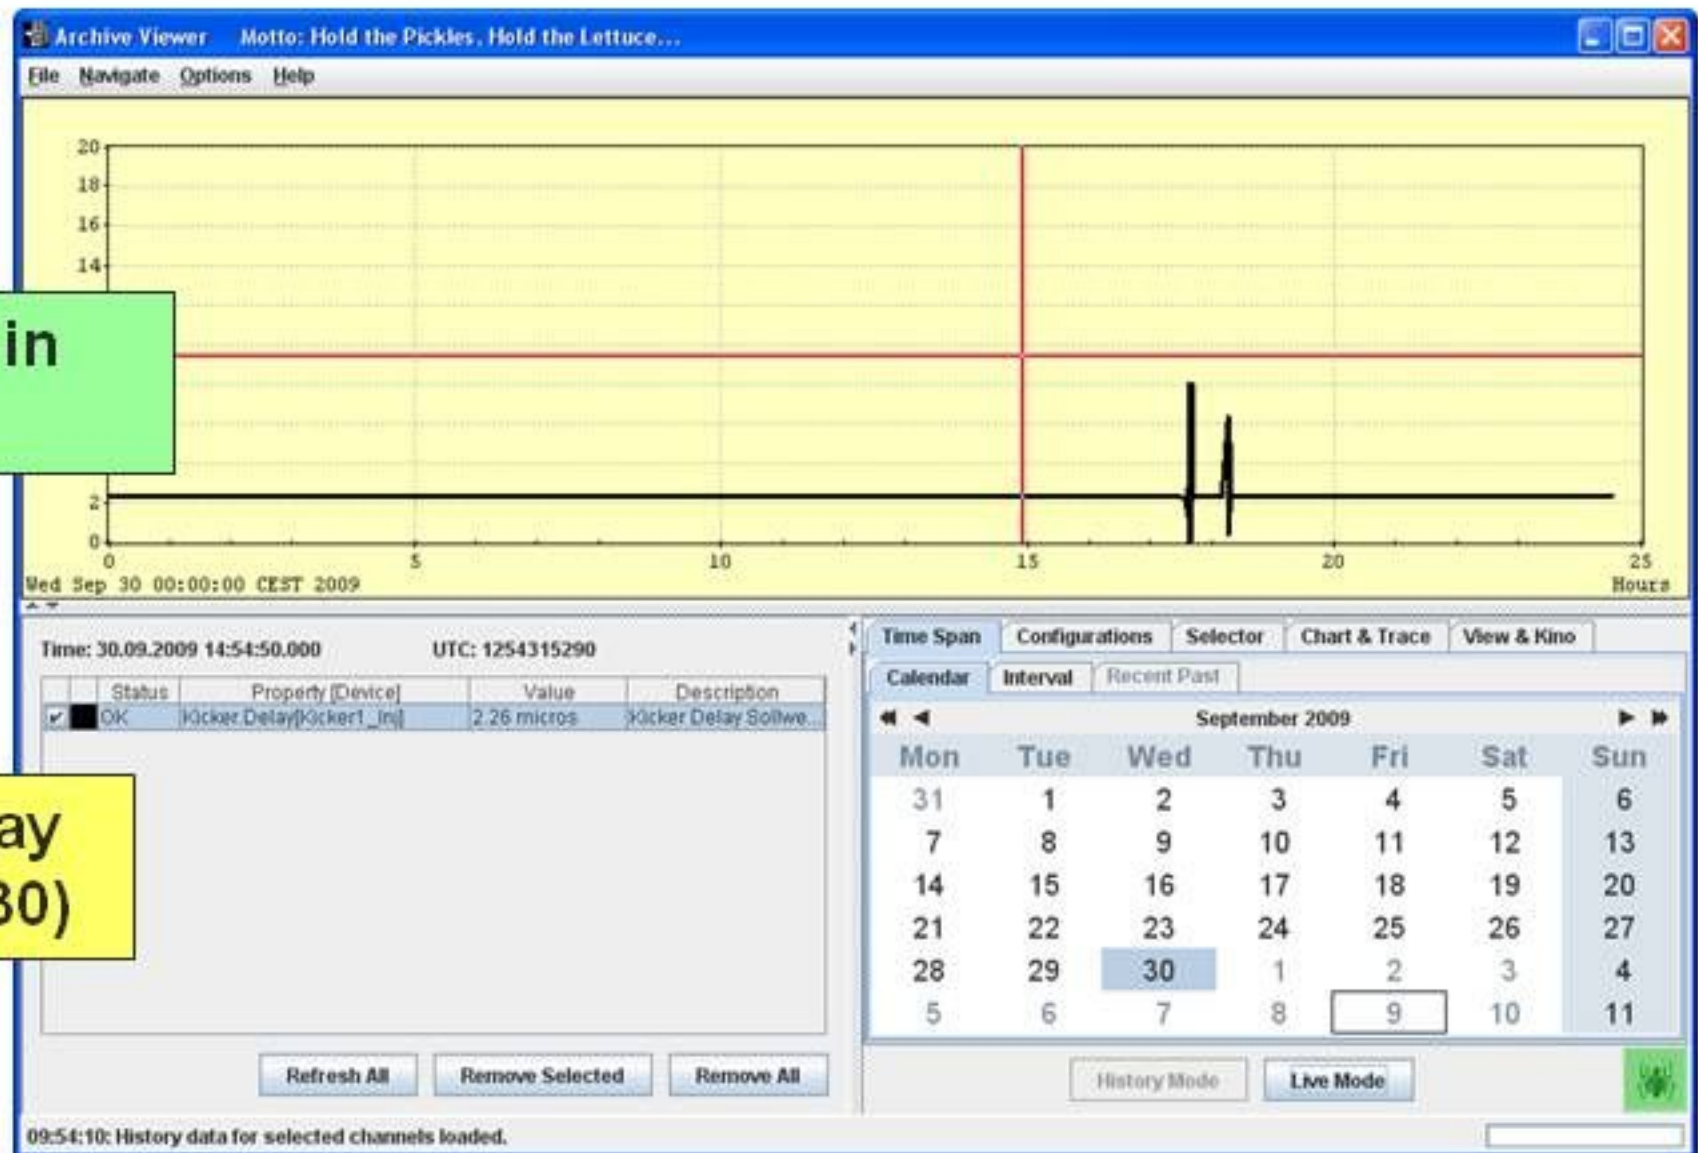

- Example of **behavioral expectations**:
  - TINE Archive is designed for **speed** !
    - **Lookups**
      - single channel over a time-range  $\sim 100\mu\text{secs/channel}$
      - MCA lookup at a single time  $\sim \mu\text{sec/channel}$
    - **Viewers**
      - Use *optical zoom* with maximum 5000 data points over a time range
      - Each zoom re-acquires archive data
      - Very fast browsing !
    - **BUT:**
      - With this viewing strategy there's a raster!
      - Will I miss 'glitches' ?

TUP034

# Hardware Engineers and TINE 4.1

Spikes appear in the afternoon

e.g. Kicker Delay Setting (Sept. 30)

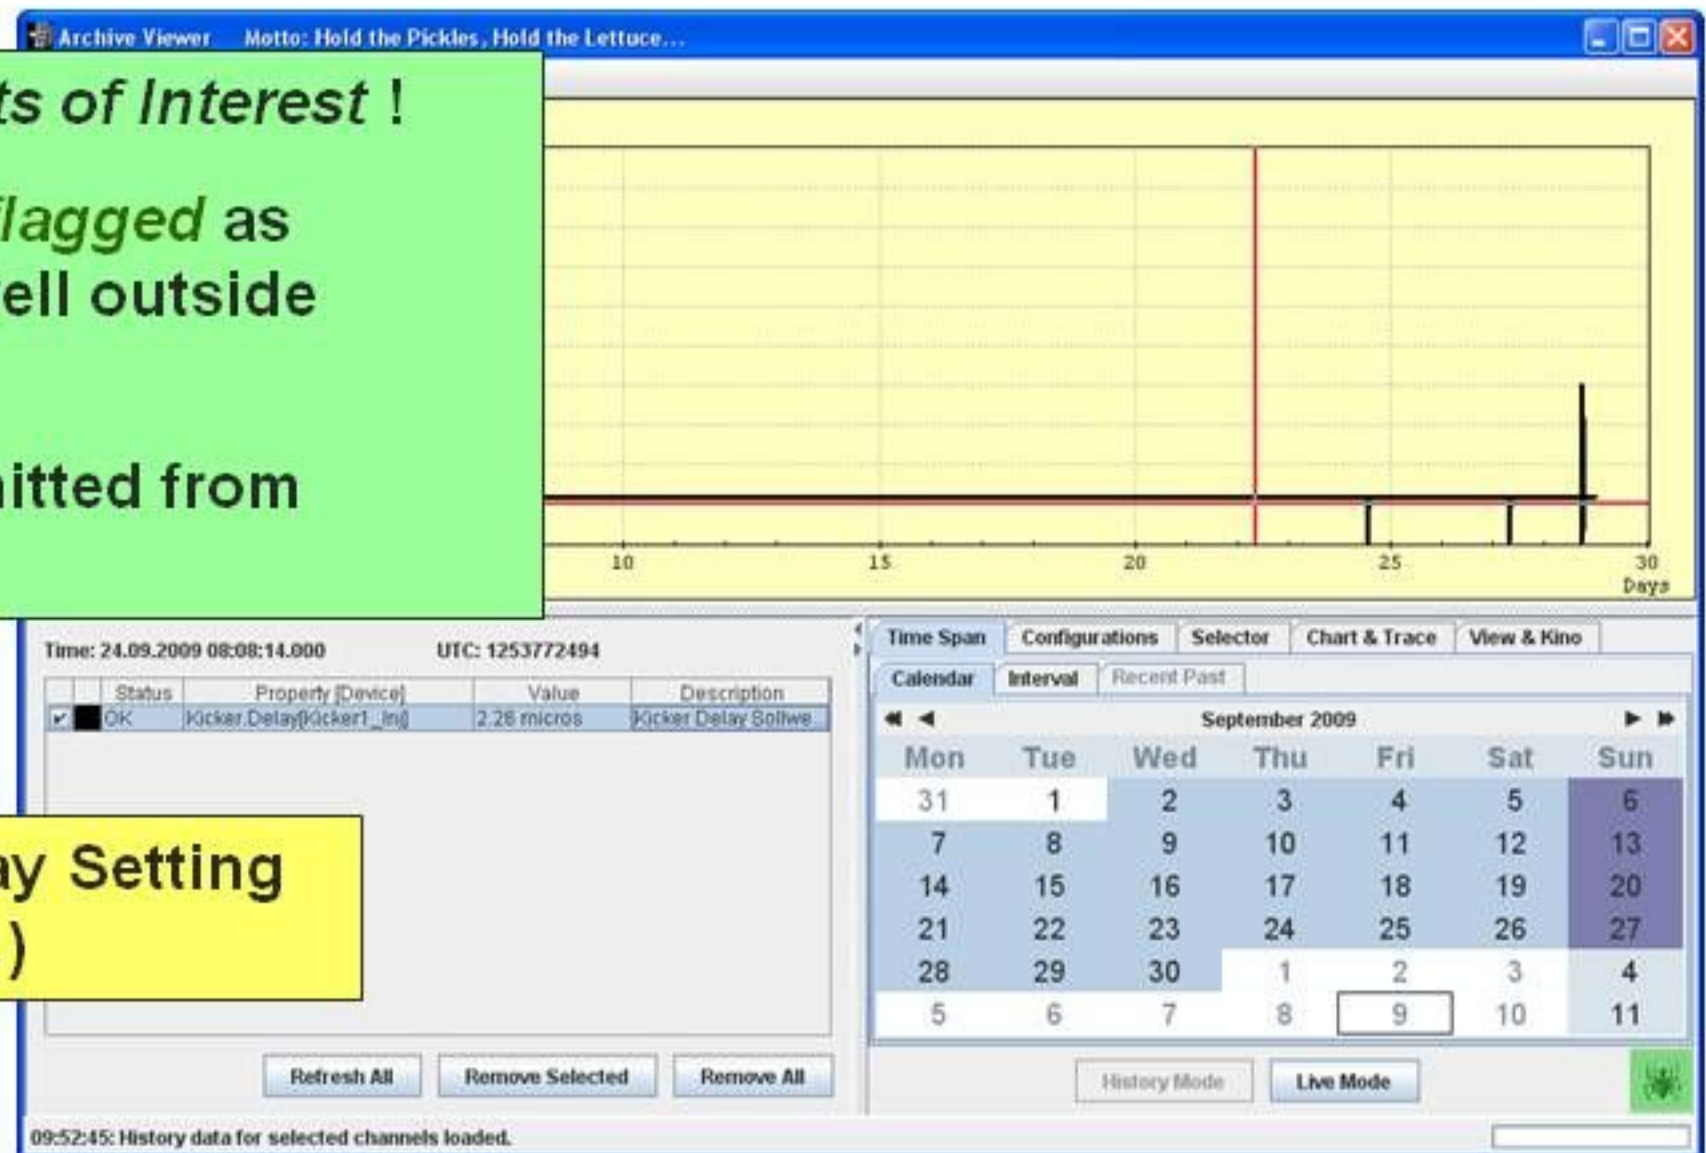

# Hardware Engineers and TINE 4.1

Introduce: *Points of Interest* !

-Archived data *flagged* as '*interesting*' if well outside tolerance!

-Will NOT be omitted from archive call!

e.g. Kicker Delay Setting  
(month of Sept.)

## Machine Physicists/Operators and TINE 4.1

- Led to improvements in **TINE Alarm System**
- Expectations led to improvements in **performance**
  - e.g. real-time video over Gigabit ethernet should allow lossless video at 100 Mbytes/sec, right?

# [ Interoperability and TINE 4.1 ]

## ■ DOOCS

- TINE is *embedded* !
- Many *impedance mismatches* found and fixed.
- Make sure name-space, format space, etc. remain *synchronized*.
- Alarms and Archives must map properly
- **Turing Test**: “Is it DOOCS or is it TINE?”

# Interoperability and TINE 4.1

## EPICS

- Need fully functional mapping between TINE and EPICS
  - `epics2tine` runs embedded on the IOC
  - `javaIOC` also has a TINE interface (cosylab)
- Understand difference between `pvData` and device server `property access`.
  - Database view vs. Property calls to a device instance.
  - Mapping is mostly straightforward
- `javaIOC`
  - requirement of structures with mutable strings
  - TINE 4.1: allow TINE structures to contain variable length data types (STRING, IMAGE, SPECTRUM)

# Interoperability and TINE 4.1

## ■ TANGO

- Generally a good fit!
- `tango2tine`:
  - TANGO has no name length restrictions; TINE does. (does one worry about this? Device Names can contain up to 1024 chars)
  - TANGO classes can either map to TINE device servers or a TINE device group
- `tine2tango`:
  - TINE structures aren't mapped at the moment
  - Servers with 'property-query precedence' do not map well.

# Interoperability and TINE 4.1

## ■ STARS/COACK

- STARS bridge to TINE maps well
- BUT:
  - STARS has no hierarchy limitations
    - Hierarchy beyond /context/server/device (i.e. sub-device, etc.) gets assigned to 'device'
    - Device names such as “device/sub-device/sub-sub-device/etc” are in general not a problem for TINE.

# [ Other Factors ... ]

- Keeping pace with [LabView](#)
- Keeping pace with [MatLab](#)
- Keeping pace with [.NET](#)
- Keeping pace with [java](#)
- Keeping pace with [Operating Systems](#) (64bit or otherwise)
  - Subtle behavioral changes with Winsock starting with Vista!
- Etc.

# [The Future ...]

- Keep running in place toward TINE 4.2 !

Thanks for your attention ...

see <http://tine.desy.de> for details ...
